No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                Score

                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic search, using sw model

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences shown in AAV54616 to AAV54621 represent LU105 specific CC polynucleotide sequences. These are used in the method of the invention CC for detecting target LU105 nucleic acid. The method comprises treating a CC sample with at least one LU105 specific nucleic acid, or its complement CC which is at least 50 percent identical with the LU105 specific nucleic acid sequences (AAV54616 to AAV54621). LU105 is a lung disease marker. CC cells transformed with a recombinant expression system that contains CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 specific nucleic acid sequences and intibodies are used to detect the LU105 antigen, and correspondingly this antigen is cused to detect specific antibodies, in usual immunoassays The LU105 CC used to detect the LU105 antigen, and correspondingly this antigen, consolitoring, prognosis, prevention, treatment and determination of consolitoring, prognosis, prevention, treatment and determination of customorphisms are also used to screen for specific binding agents, useful therapeutically. LU105 is a marker for lung disease (present at high concentration, in altered form or in an unusual body compartment). LU105 cc can be detected in blood, plasma or serum in an inexpensive, non-invasive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                           The present sequence is a lung specific gene (LSG) Lng107 from human clone ID 586271. The LSG has high level of tissue specificity for lungs and is overexpressed in cancerous tissues. The sequence serves as a diagnostic marker for detecting, monitoring, staging and prognosticating lung cancer. The diagnosis involves comparing levels of LSG in samples obtained from patient and normal control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAZ29723 standard; DNA; 543

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc Sequences shown in AAV$4616 to AAV$4621 represent LU105 specific copolynucleotide sequences. These are used in the method of the invention cf for detecting target LU105 nucleic acid. The method comprises treating a sample with at least one LU105 specific nucleic acid, or its complement cwhich is at least one LU105 specific nucleic acid, or its complement which is at least 50 percent identical with the LU105 specific nucleic cald sequences (AAV$4616 to AAV$4621). LU105 is a lung disease marker. Calls transformed with a recombinant expression system that contains clu105 specific nucleic acid fragments, are used to express recombinant curve antibodies. The antibodies are used to detect the LU105 antigen, and correspondingly this antigen is cused to detect specific antibodies, in usual immunoassays. The LU105 cused to detect specific antibodies, in usual immunoassays. The LU105 controling, prognosis, prevention, treatment and determination of cusceptibility to, lung disease, specifically cancer. The LU105 cusceptibility to, lung disease, specifically cancer. The LU105 concentration, in altered form or in an unusual body compartment). LU105 can be detected in blood, plasma or serum in an inexpensive, non-invasive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             γQ

                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of novel human PRO polypeptides and the polynuclectide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glaal, astrocytal, hypothalamic, glandula macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumours, leukaemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  11-FEB-2000;
                                                                                                                                                                                                                                                                                                                                                                                                               Claim 50; Fig 27; 302pp; English.

                                                                                                                                                                                                                                                                                                         The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20 - AUG - 1998

PRO polynucleotides used bioactive molecules such specific cells, to cause to produce polypeptides used to target as toxins, radiolabels or antibodies, to targeted cell death -

Claim 2; Fig 289; 935pp; English.

The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO

Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes us in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynuclotide and protein sequences given in the exemplification of the present invention.

CC The invention describes an isolated human PRO polypeptide. The PRO CC polypeptides are useful in detecting PRO polypeptides in a sample, in CC linking a bioactive molecule to a cell expressing a PRO polypeptide, and CC in modulating at least one biological activity of a cell expressing a PRO CC polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus CC useful for treating cardiac insufficiency disorders. PRO1134 and PRO186 CC stimulate adrenal cortical capillary endothelial growth, and PRO186 CC PRO1360 and PRO187 induce c-fos in endothelial growth, and PRO186 CC PRO1360 and PRO187 induce c-fos in endothelial cells, and are thus useful for treating cancerous tumours. PRO812 inhibits vascular CC endothelial growth factor (VEGF) stimulated proliferation of endothelial cells and is thus useful for inhibiting endothelial cell growth. PRO826, PRO186, PRO186, PRO186, PRO186, PRO186, PRO186, PRO186, PRO187 stimulated proliferation of endothelial cell growth in CC mammals which would be beneficial in inhibiting tumour growth. PRO826, CC pro1068, PRO186, PRO1375 stimulated proliferation of condinated Tymphocytes and are therapeutically useful for enhancing condinated proliferation of mammaliane kidney disorders of injuries, PRO826, PRO188 or PRO132 enhances survival/proliferation of condisorders of injuries, PRO826, PRO188 or PRO132 enhances survival/proliferation of mammaliane kidney mesangial cells, and therefore are useful for treating sports injuries, and are thus useful for treating cells cells, and therefore are useful for treating sports injuries, and are therapeutical and kidney mesangial cells, and therefore are useful for treating sports injuries, and are therapeutical and kidney mesangial cells, and therefore are useful for treating sports injuries, and arthritis. This sequence represents a novel human PRO protein polynucleotide.

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, or in generating probes as

Claim 2 Fig 289; 650pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid cencoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bioactive combination of the properties and properties and for modulating at least CC one biological activity of a cell. The PRO polypeptides or polynucleotides are also useful in gene therapy, in chromosome cc identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein cell-critication, as the isolated nucleic acids may be used for cecombinantly expressing those markers. The PRO polypeptides are useful cardismay also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from CC acids may also be used in tissue typing. Anti-PRO antibodies are useful cardismay also be used in tissue typing. Anti-PRO antibodies are useful and in affinity purification of PRO from CC acids may also assays for PRO, and in affinity purification of PRO from CC acids may also are the genes encoding, the primers amplifying and the CC probes detecting the PRO polypucleotides of the invention.

CC probes detecting the PRO polypucleotides of the invention.

CC format from USPTO at segdata.uspto.gov/sequence.html.

comprising a sequence without signal peptide and the nucleic acid comprising a sequence without signal peptide and the nucleic acid composition of the polypeptides can be used to raise antibodies that expecifically bind to the PRO polypeptide, for linking a bloactive come biological activity of a cell. The PRO polypeptides or modulating at least come biological activity of a cell. The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, come biosensors or bioreactors, for detecting or treating e.g. tumours in commands, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or crabbits as targets for therapeutic intervention in certain cancers (e.g. colon, lung or breast cancers) and diagnostic determination of the presence of these cancers. The PRO polypeptides are also useful as completed as hybridisation probes or for screening libraries of human colon, genomic DNA or mRNA. The PRO genes may also be used in gene colon, persented in ABX79200-ABX90575 are the genes encoding, the primers can prifying and the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the colon probes of the probes detecting the PRO polynucleotides of the probes detecting the probes detecting 
invention.

immunosuppressive; transgenic;
         REPRESENTED TO SOLUTION OF THE PROPERTY OF THE
                                    The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The CC prolypeptides are secreted and transmembrane proteins. The PRO CC linking bioactive molecules to cells expressing PRO polypeptides, for CC linking bioactive molecules to cells expressing PRO polypeptides, for CC polypeptides, and for for identifying agonists or antagonists. CC polypeptides, and for for identifying agonists or antagonists. CC hybridiation probes, in chromosome and gene mapping, in the generation CC of antisense RNA and DNA, in the preparation of PRO polypeptides, for CC polypeptides and for mapping the gene which encodes the PRO CC polypeptide, and for the generation analysis of individuals with genetic CC polypeptide, and for the genetic analysis of individuals with genetic CC disorders, in gene therapy, for chromosome identification, as chromosome markers, and for generating probes for PCR, Northern CC disorders, southern analysis and Western analysis. The present Note: The sequence data for this patent was obtained in electronic CC format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ashkenazi AJ, Baker K

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a secreted and transmembrane polypeptide, termed CC PRO polypeptide, and the polypeptides according it. The polypeptide is CC useful for detecting, PRO polypeptides and for linking a bloactive conclude to a cell expressing the above polypeptides, where the bloactive molecule to a cell expressing the above polypeptides, where the bloactive causes the death of the cell. The polypeptide is useful for identifying cagonists or antagonists of the PRO polypeptide is useful for identifying candists or antagonists of the PRO polypeptide, for preparing variants of PRO, as a molecular weight marker for protein electrophoresis purposes cand the PRO polypuctide is useful for recombinantly expressing those concludes the polypuctide is useful for an antisation probe, in the preparation of propertide is also useful as a hybridisation probe, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and concentrating of therapeitically useful reagents, to construct hybridisation probes for mapping the gene which encodes PRO and for the genetic canalysis of individuals with genetic disorders, in gene therapy, for probes for mapping the gene which encodes PRO and for the genetating canalysis of individuals with genetic disorders, in gene therapy, for probes for pcr, Northern analysis, Southern analysis and Western analysis. Northern analysis, Southern analysis and western in vention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

RESULT 5

US-60-213-178-297/c

Sequence 297, Application US/60213178

Sequence 297, Application US/60213178

SEQUENCE INFORMATION:

TITLE OF INVENTION: ISOLATED HUMAN KINASE PROTEINS, NUCLEIC

TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN KINASE PROTEINS, AND USES

TITLE OF INVENTION: THEREOF

FILE REFERENCE: CL00689

CURRENT APPLICATION NUMBER: US/60/213,178

CURRENT FILING DATE: 2000-06-22

NUMBER OF SEQ ID NOS: 1425

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 297

LENGTH: 32768

Sequence 120, Application US/10059579A

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: THE JOHNS HOPKINS UNIVERSITY SCHOOL OF MEDICINE
APPLICANT: SUKUMAR, Saraswati
APPLICANT: EVROW, Ella
APPLICANT: DOOLEY, William C.
APPLICANT: DAVIDSON, Mancy
APPLICANT: DAVIDSON, MANCY
TITLE OF INVENTION: ABERRANTLY METHYLATED GENES AS MARKERS OF BREAST MALIGNANCY
TITLE OF INVENTION: ABERRANTLY
TITLE OF INVENTION: ABERRANTLY
TITLE OF INVENTION: ABERRANTLY
TITLE OF INVENTION: ABERRANTLY
TITLE OF INVENTION: UNMBER: US/10/059,579A

CURRENT FILING DATE: 2002-01-28
PRIOR APPLICATION NUMBER: US 09/771,357
PRIOR APPLICATION NUMBER: US 09/771,357
PRIOR FILING DATE: 2001-01-26
NUMBER OF SEQ ID NOS: 136
SOFTWARE: Patentin version 3.1
SEQ ID NO 120
LENGTH: 1794
TYPE: DNA
ORGANISM: Homo saplens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IDENTITY_NUC Gapop 10.0 , Gapext 1.0

Sequence 16806, Application US/60495114

GENERAL INFORMATION:
GENERAL INFORMATION:
HITCH OF INVENTION: DOLYMORPHISMS IN NUCLEIC ACID MOLECULES
TITLE OF INVENTION: DESCRIBENCE FROTEINS, METHODS OF DETECTION AND
TITLE OF INVENTION: USES THEREOF
FILE REFERENCE: CL001480
CURRENT APPLICATION NUMBER: US/60/495,114
CURRENT FILING DATE: 2003-08-15
NUMBER OF SEQ ID NOS: 91238
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 16806
LENGTH: 27991
TYPE: DNA
ORGANISM: Homo sapiens
FEATURE:
RAME/KEY: misc_feature
LOCATION: (1)...(27991)
COTHER INFORMATION: n = A,T,C or G, or insertion/deletion polymorphism (see Tables 1-
OTHER INFORMATION: n
                                                                                                                                                                                 Qy
                                                                                                                                                                                                                            B
                                                                                                                                                                                                                                                       Qy

source anonymous pool of 6 male brains, age 69. Library is
oligo-dT primed and directionally cloned (EcoRV site is
destroyed upon cloning). Average insert size 11 & kb,
insert size range 1-3 kb .Library is normalized and enriched for full-length clones and was constructed by C.
organic close of the close of the clones are constructed by C.
Oligo of the close of the clones of the close of the close of the clones of the close of t

male lung, age 27; and 1 male testis, age 69. Library is
oligo-dT primed and directionally cloned (Ecorv Site is
destroyed upon cloning). Average insert size 1.8 kb,
insert size range 1-3 kb. Library is normalized and
enriched for full-length clones and was constructed by C.
